

Medical

DDS securely shares patient and device data to build smarter clinical information systems. It connects devices in hospital rooms, integrates whole-hospital systems, and connects to the cloud and mobile technologies. The proliferation of smart medical devices creates new integration challenges for networks of devices. DDS provides a proven solution for the secure transfer of real-time data between medical devices and other information systems in a clinical environment.

Medical Devices and Clinical Systems

The Medical Device “Plug-and Play” (MD PnP) Interoperability Program is using DDS in the reference implementation for their Integrated Clinical Environment (ICE) to enable the integration of devices and the sharing of real-time patient data between devices and other clinical information systems.

Imaging Systems

Imaging systems require massive data flows and fast performance. DDS controls and optimizes network use to handle megabytes of load without losing data.

Integrated Clinical Medical Decision Systems

DDS ties together devices, services, and displays in real time.
