

GROUP_DATA QoS Parameter

[return to the Quality of Service \(QoS\) Parameters](#)

The GROUP_DATA QoS allows the application to attach additional information to the created [Publisher](#) or [Subscriber](#). The value of the GROUP_DATA is available to the application on the DataReader and DataWriter entities and is propagated by means of the built-in topics.

This QoS can be used by an application combination with the DataReaderListener and DataWriterListener to implement matching policies similar to those of the [PARTITION QoS](#) except the decision can be made based on an application-defined policy.
