

Reboot the World Problem

[Return to Glossary](#)

Reboot the World Problem occurs when an integral, underlying component of a system (usually [middleware](#)) changes requiring all the components that rely on that component to require a reboot in order to remain operational and interact with the other distributed components within the system. This is a cause of fragility in the overall system and is a major problem for [missioncritical](#) and [safetycritical](#) and risk the prime purpose for the systems.
