4.1.1.4 Network Platforms

Return to Platforms

A DIDO, by definition, is a collection of networked nodes. Traditionally, the network is assumed to be Ethernet with nodes connected over Local Area Network (LAN) and/or a Wide Area Network (WAN) using a Network Device.

The connections can either be Wired Network or Wireless Network using Wireless Fidelity (Wi-Fi).

However, there is a lot of growth and development using other wireless connections other than Ethernet. For example:

- Bluetooth
- ZigBee
- Near-Field-Communication (NFC)
