Cyphertext

Return to Glossary

Cyphertext is Data in its encrypted form [1].

Cyphertext is encrypted text transformed from Plaintext using an Cryptographic Algorithm.

Ciphertext can not be read until it has been converted into Plaintext (using Decryption) with a key. The decryption cipher is an algorithm that transforms the **Ciphertext** back into Plaintext.

The term cypher is sometimes used as a synonym for **cyphertext**. However, it refers to the method of encryption rather than the result.
