Graph DataBase (GDB)

Return to Glossary

A *Graph DataBase **is a NoSQL-type database system based on a topographical network structure. The idea stems from graph theory in mathematics, where graphs represent data sets using nodes, edges, and properties.** * Nodes **or points are instances or entities of data which represent any object to be tracked, such as people, accounts, locations, etc.** * Edges **or lines are the critical concepts in graph databases which represent relationships between nodes. The connections have a direction that is either unidirectional (one way) or bidirectional (two way).** * Properties **represent descriptive information associated with nodes. In some cases, edges have properties as well. Source: https://phoenixnap.com/kb/graph-database ~~DISCUSSION:on|Outstanding Issues~~ ~~DISCUSSION:off~~**
