Hardware (H/W)

Return to Glossary

Hardware (H/W) refers to the physical elements that make up a computer or electronic system and everything else involved that is physically tangible. This includes the monitor, hard drive, memory and the CPU. Hardware works hand-in-hand with firmware and software to make a computer function.

Although the same core components are shared between Desktop and Laptop computers, their characteristics and design differ for a multitude of reasons (size, heat dissipation capabilities, power requirements, etc.). However, hardware is always necessary to run the critical software that makes computers work.
