Logic Error

Return to Glossary

A **Logic Error** is a bug in a program or application allowing it to operate incorrectly, but not to terminate abnormally (or crash). A logic error produces unintended or undesired output or other behavior, although it may not immediately be recognized as such.

Logic Errors occur in both compiled and interpreted languages. Unlike a program with a Syntax Error, a program with a **Logic Error** is a grammatically valid program, however, it does not behave as intended. Often the only clue to the existence of **Logic Errors** are the production of wrong solutions, though static analysis may sometimes spot the issues, often they do not.
